

The **1 x 1 Bi-Color LED Flood Light** from **Litepanels** is a professional-quality light with a variable 3200 to 5600K color temperature, a 50° beam angle, and the equivalent output of a 200W HMI light. Other features of the panel include heat- and flicker-free LED lights along with the ability to dim the light from 100 to 0% without any noticeable color shift. This combines with the modular design of the panel to work in multi-panel configurations to make a versatile lighting system.

The Bi-Color LED Flood Light also has an integrated DMX module with an Ethernet port for remote operation and dimming using the DMX512 protocol. This is assisted by a 1.75" thickness and lightweight 3 pound build that allows this light to be squeezed into a wide variety of locations.

During operation, this light has a low 40W power draw and can even work on battery power. It also has a view-thru design for seeing the adjustments you are making to the scene. Included with the light is a manual yoke, a power supply, a power cord, and a power supply mounting bracket.

LEDs have long life of approximately 50,000 hours

Operates on 14-28 VDC power for use with battery packs

Ballast-free design
